

About transfer of digital signature, cipher related files

On iPhone/iOS, it seems that some special measures have been taken to transfer files and accept transfers for files whose file extensions are as follows:

cer

crt

der

pem

pxf

Therefore, it is impossible to transfer or accept files with such extensions.

If you change the extension or remove the extension, it seems that you will be able to transfer and accept transfers.

gcmc has not addressed this issue at this time.

Therefore, you can not transfer a file whose extension is this, or accept the transfer.

If you want to use gcmc to transfer files with this extension or to accept transfers, please change the extension or remove the extension.

At this time, gcmc does not have plans to address this issue.
