

(BinaryKey) Browsing Decryption

This decryption command does not output the decryption result to a file, but displays it in text view.

The main (Binary-Key) "Browsing-Decryption" button will bring up the view below.

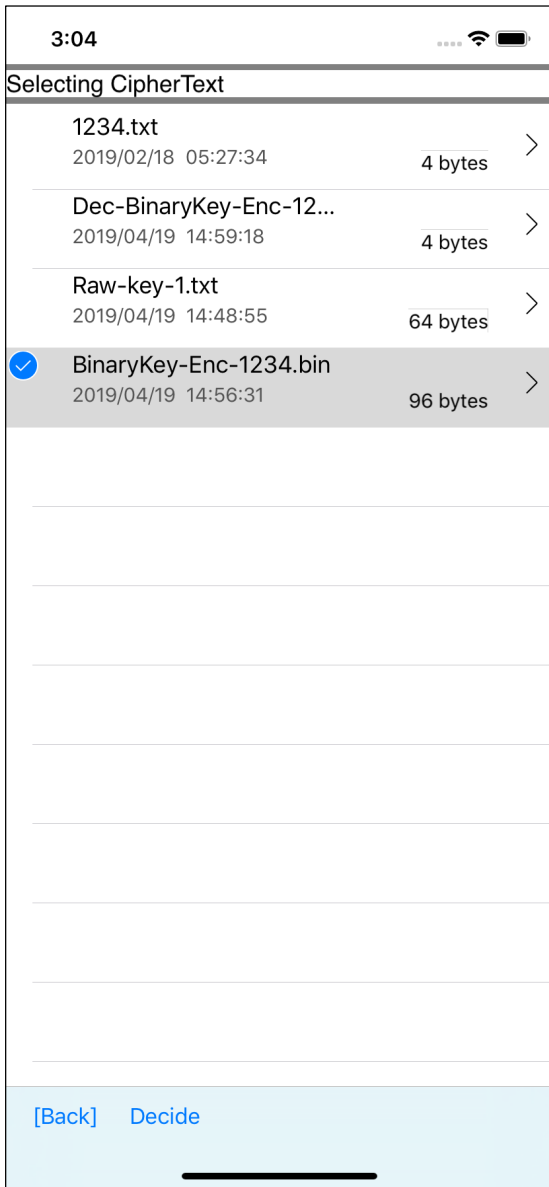

The user interface looks like this.

File name to be decrypted

Decryption key

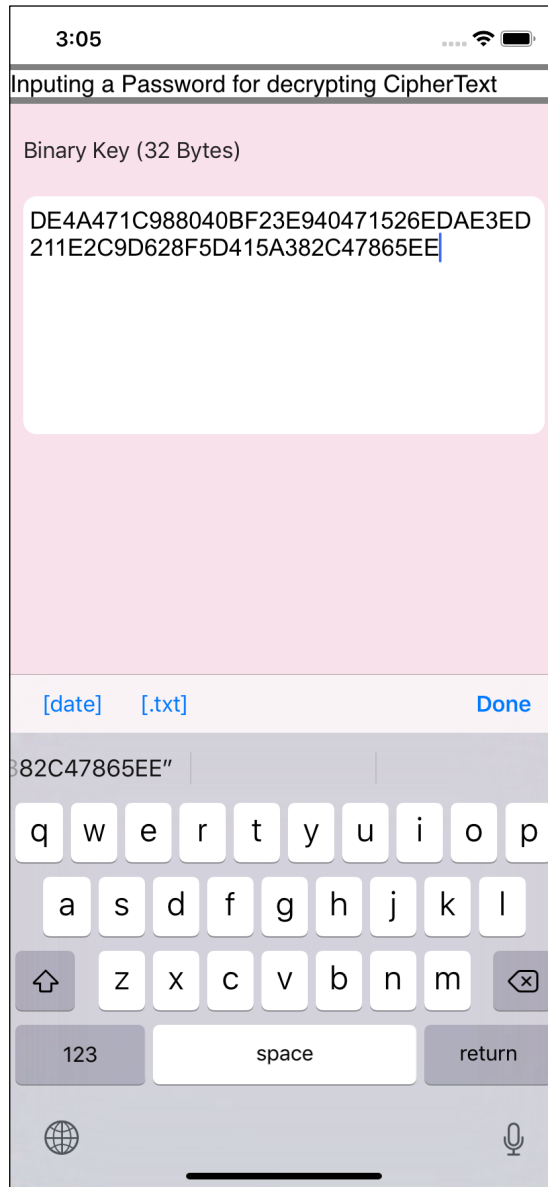

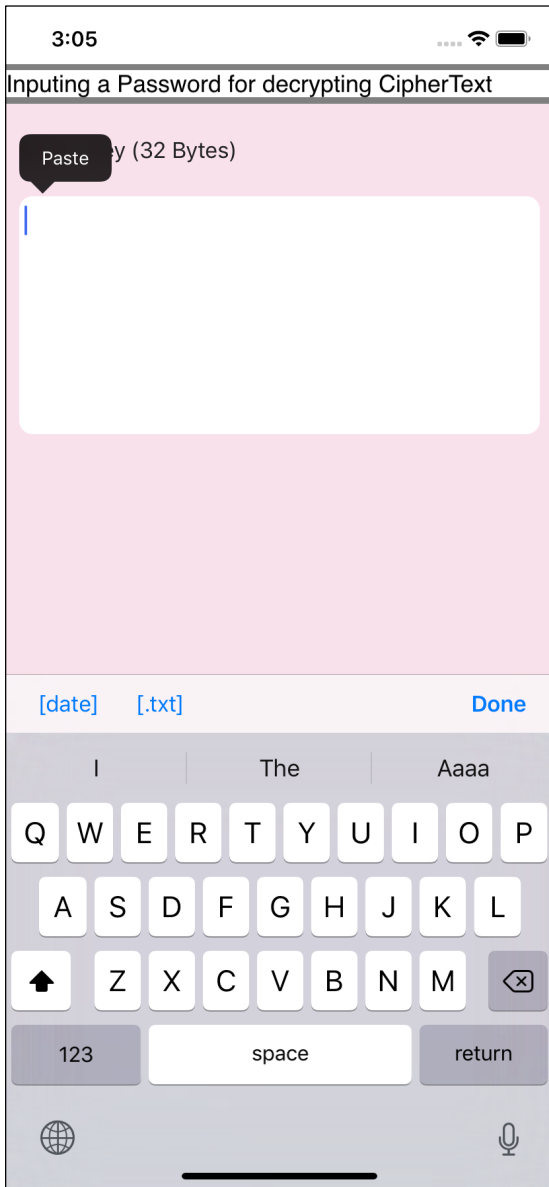

Decryption result display text view

This is the meaning.

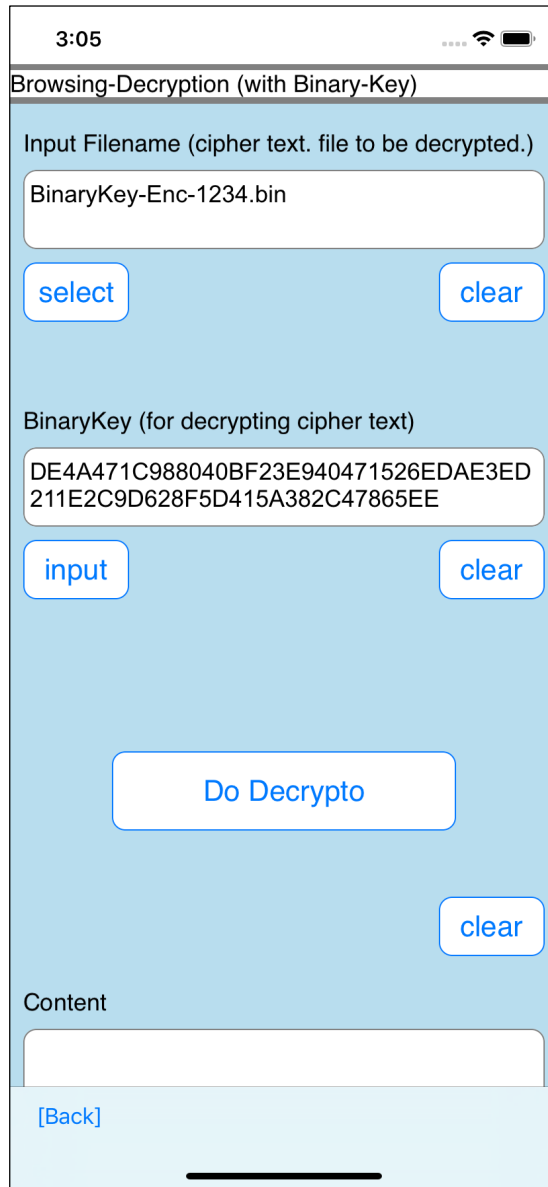

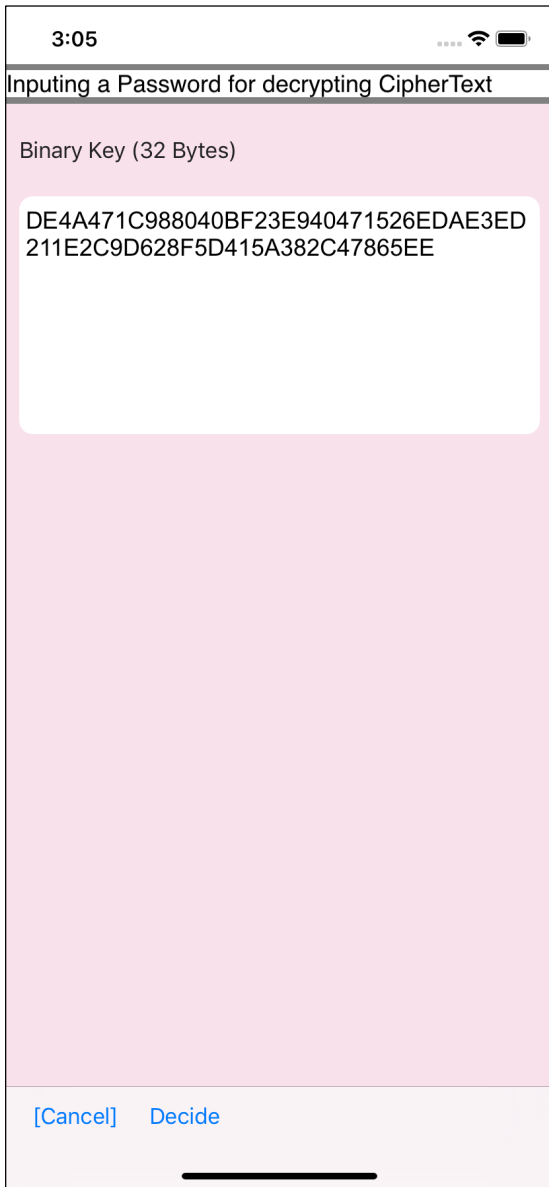

When you press the “select” button under the text view of the file name to be decrypted, the table view shown on the left appears.

Select a file and press the “Decide” button on the toolbar to return.

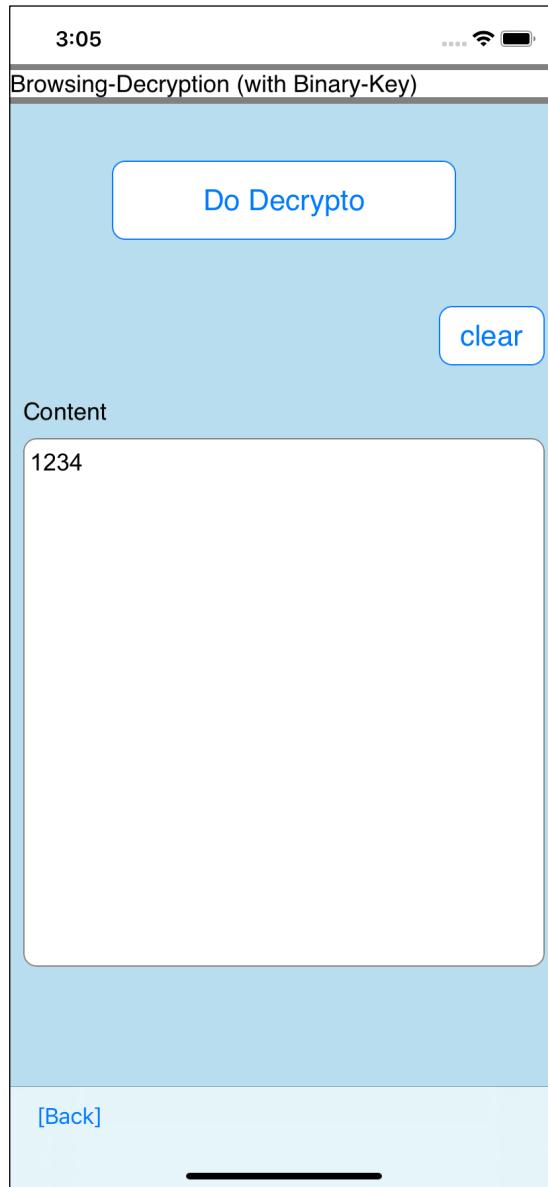

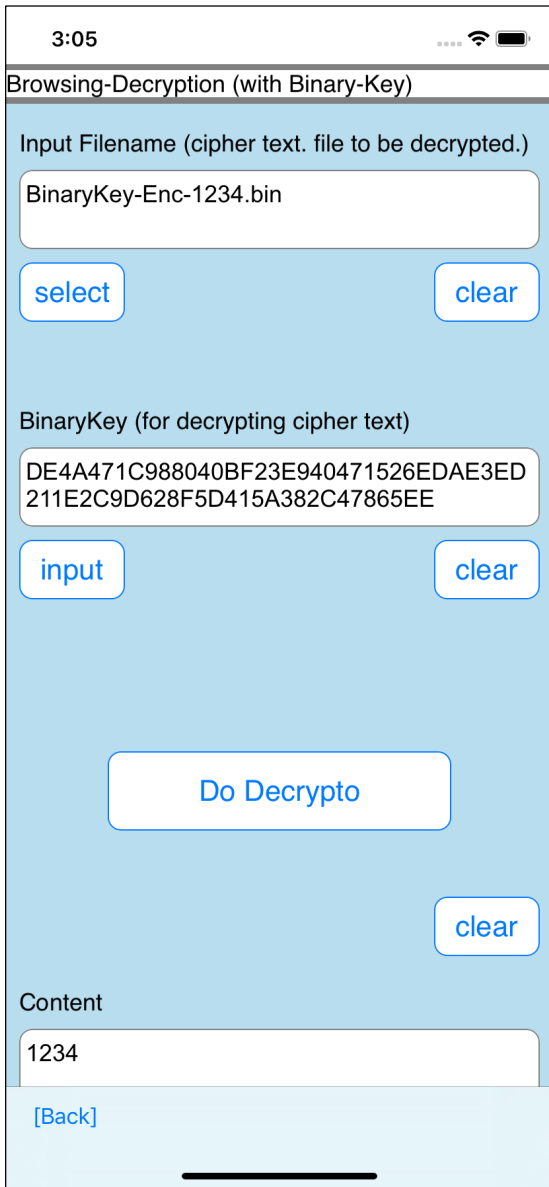

Press the “input” button below the decryption key, and the decryption key entry view as shown on the left appears.

In fact, I think it will be copy and paste like this.

Whatever the method, enter the decryption key and press the "Decide" button on the toolbar to return.

In this state, if you press the “Do Decrypto” button, the decryption result will be displayed in the text view.

The picture on the right is just a scroll.
