

(NoData) 2 files

This command creates a password from two files.

When the main (NoData) "2 File" button is pressed, the following view appears.

The user interface looks like this.

Name of the first file from which to generate the password

Name of the second file from which to generate the password

Output format

Password length

Generated password

This is the meaning.

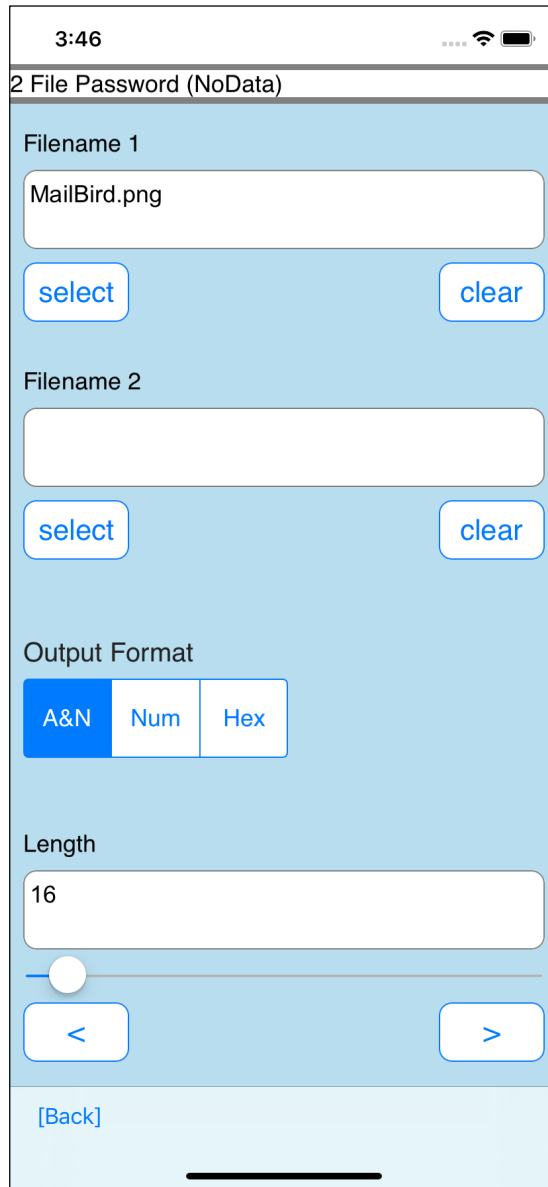

The first example is folloing:

First File MariBird.png

Second File QR-1234.png

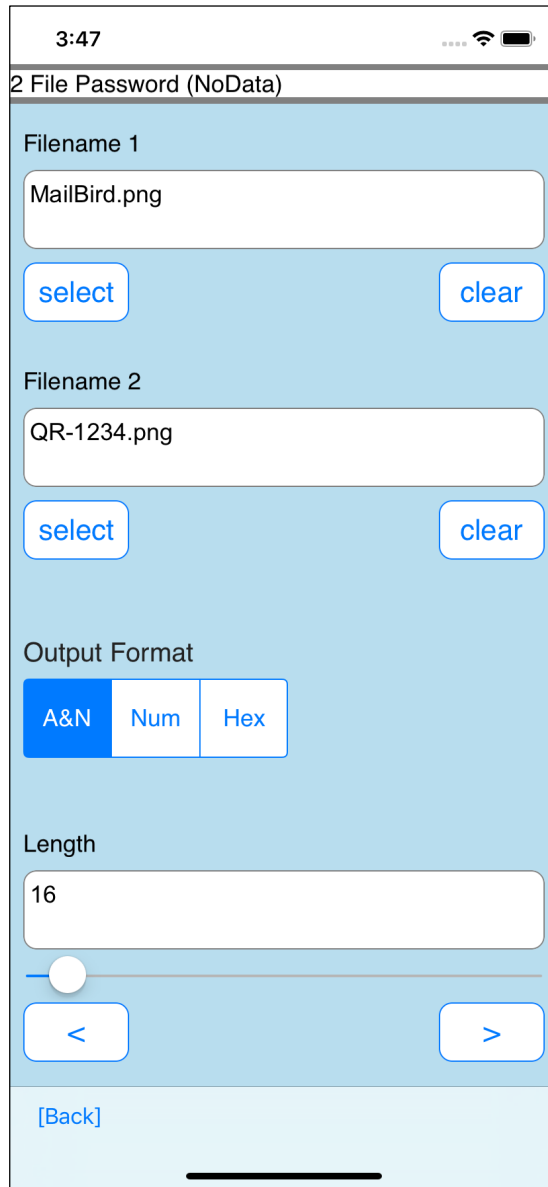

The order in which you specify the files makes sense.

If the specified order changes, it will be a different password.

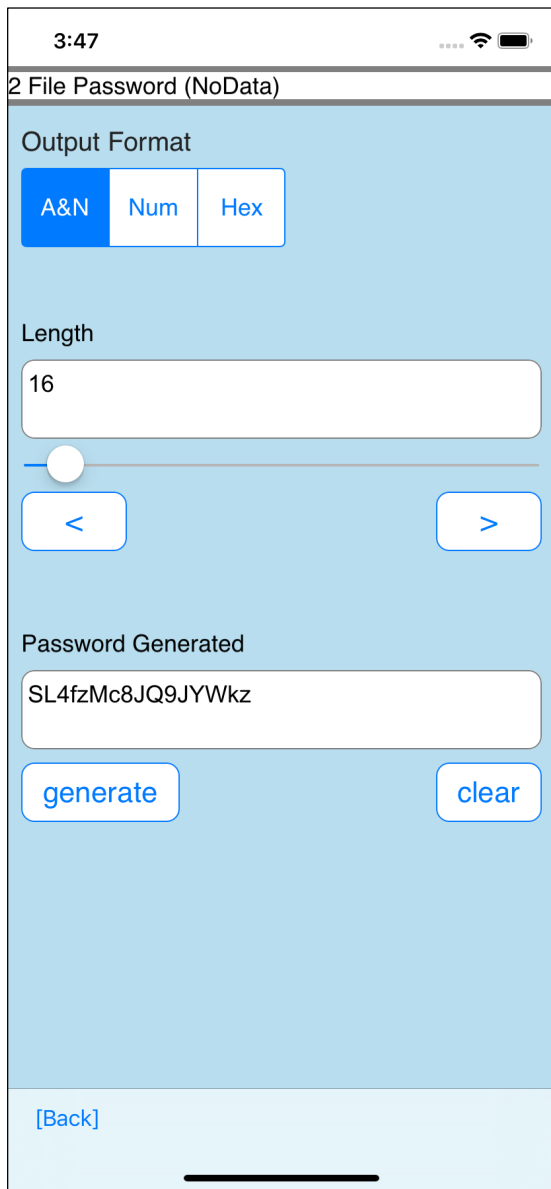

You can get a text view like this by pressing the lower left “select” button of the text view with the file name.

Select a file and press the “Decide” button on the toolbar to return as shown below.

You can get a text view like this by pressing the lower left “select” button of the text view with the file name.

Select a file and press the “Decide” button on the toolbar to return as shown below.

First File MariBird.png

Second File QR-1234.png

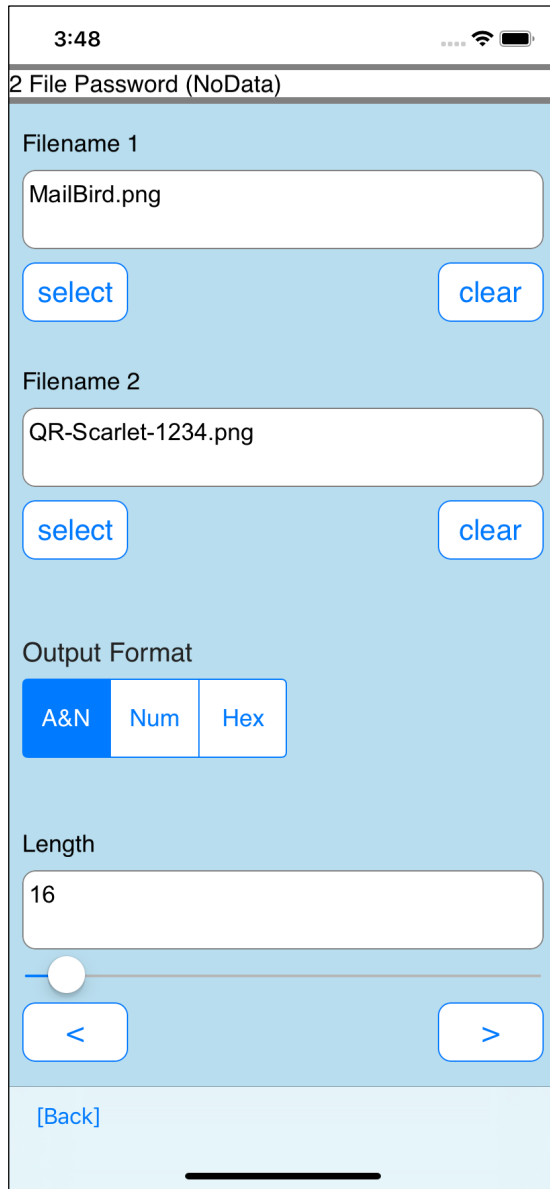

from these two files, the password

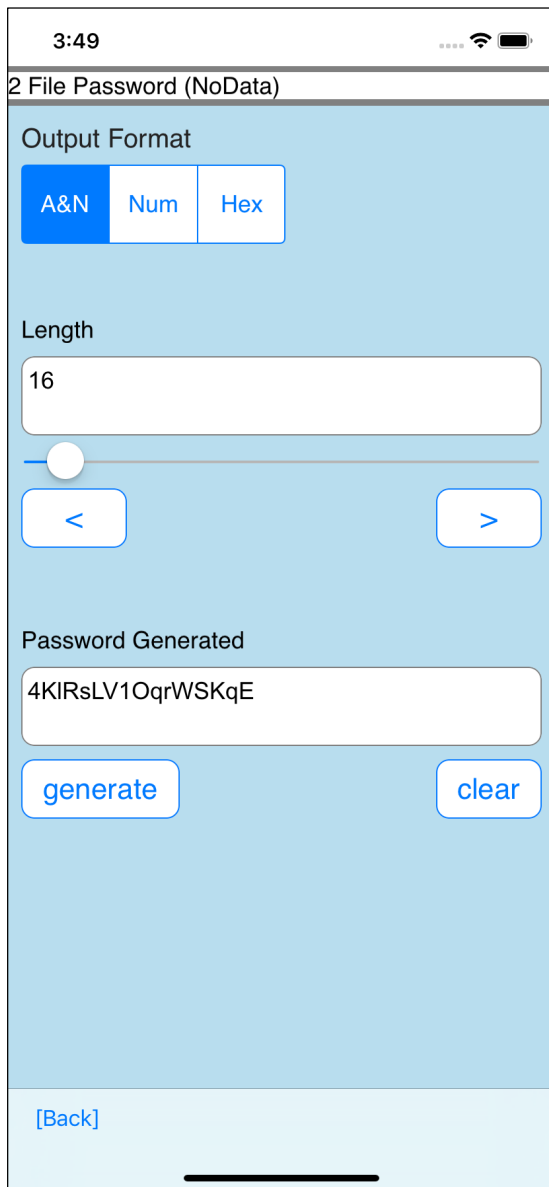

SL4fzMc8JQ9JYWkz

is generated

Let's replace the second file with this one.

In this way,

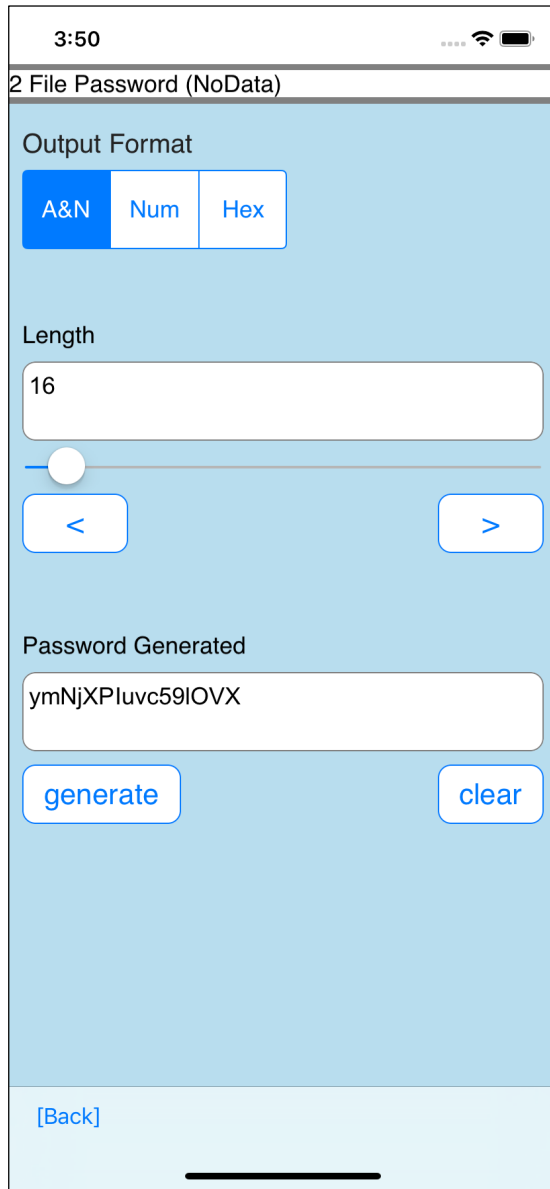

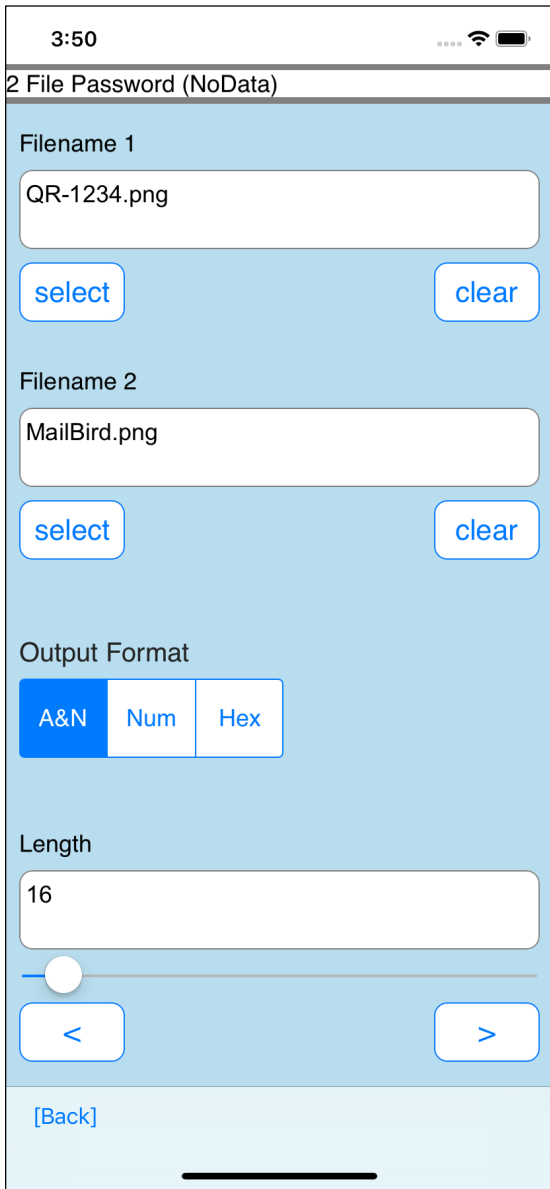

First File MariBird.png

Second File QR-Scarlet-1234.png

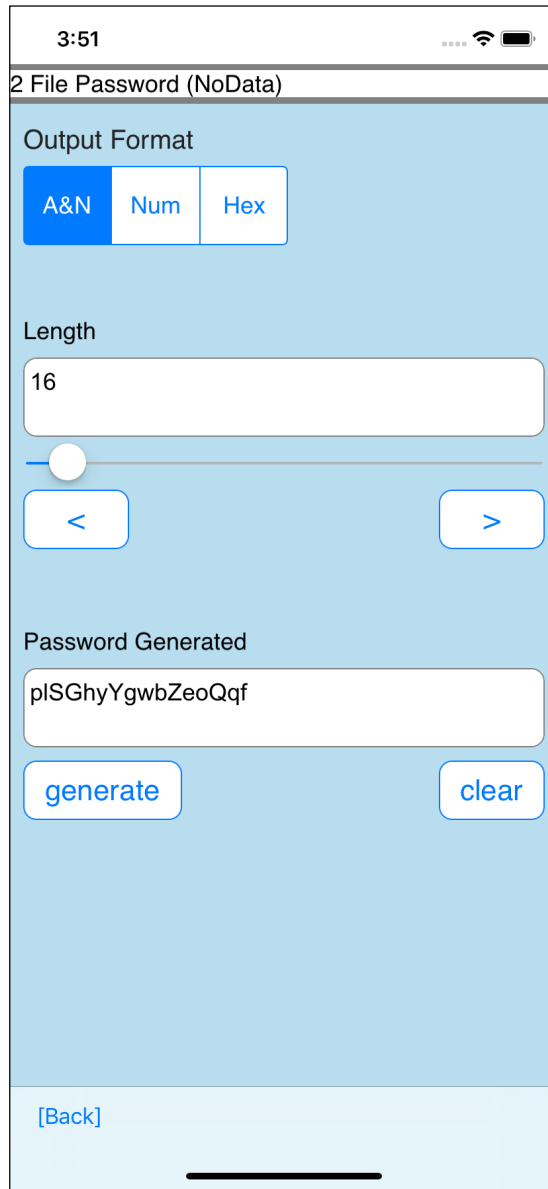

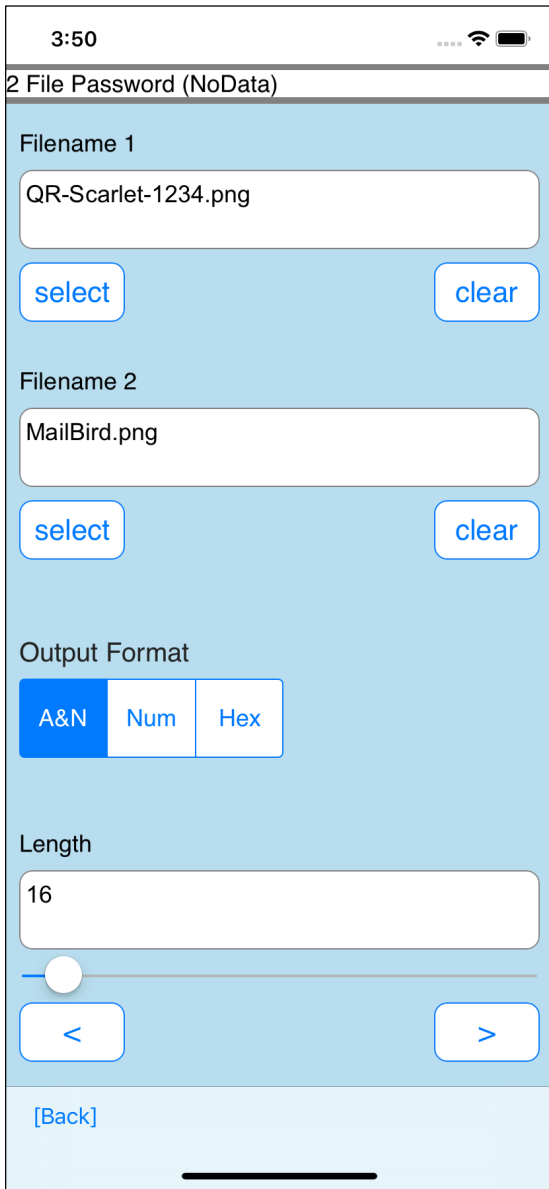

from these two files, the password

4KIRsLV1OqrWSKqE

is generated

If you change the order, it will be this password.

This is also the same, and if the file specification order changes, it will be a different password.
