

(With Keyfile) Browsing Decryption

This decryption command does not output the decryption result to a file, but displays it in text view.

The main "Keyfile" "Browsing-Decryption" button will bring up the view below.

The user interface looks like this.

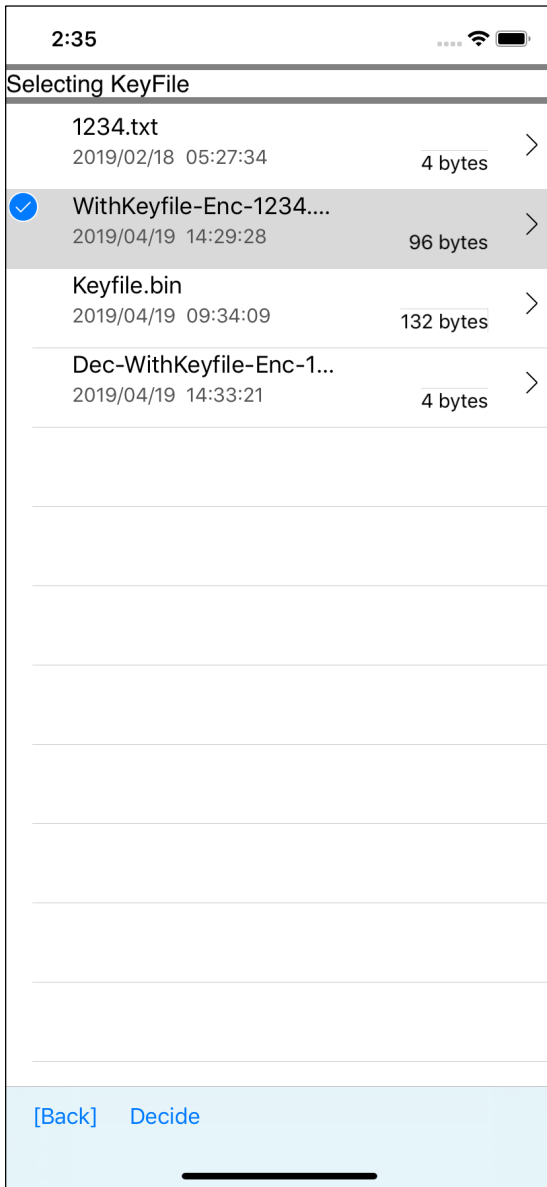

Key file name

Key file decryption password

Decryption result display text view

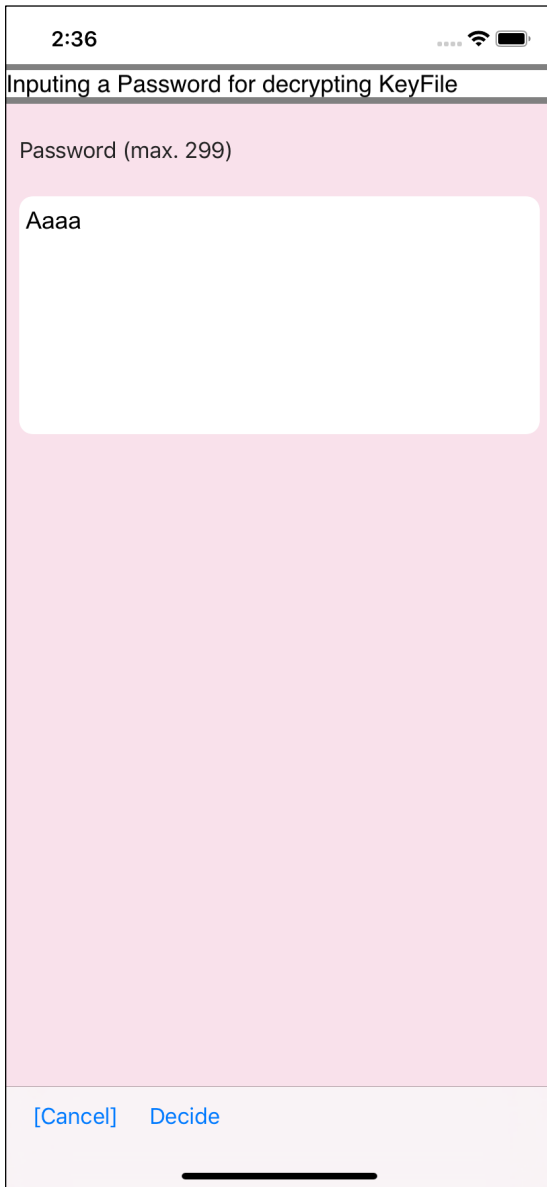

Decryption target file name

This is the meaning.

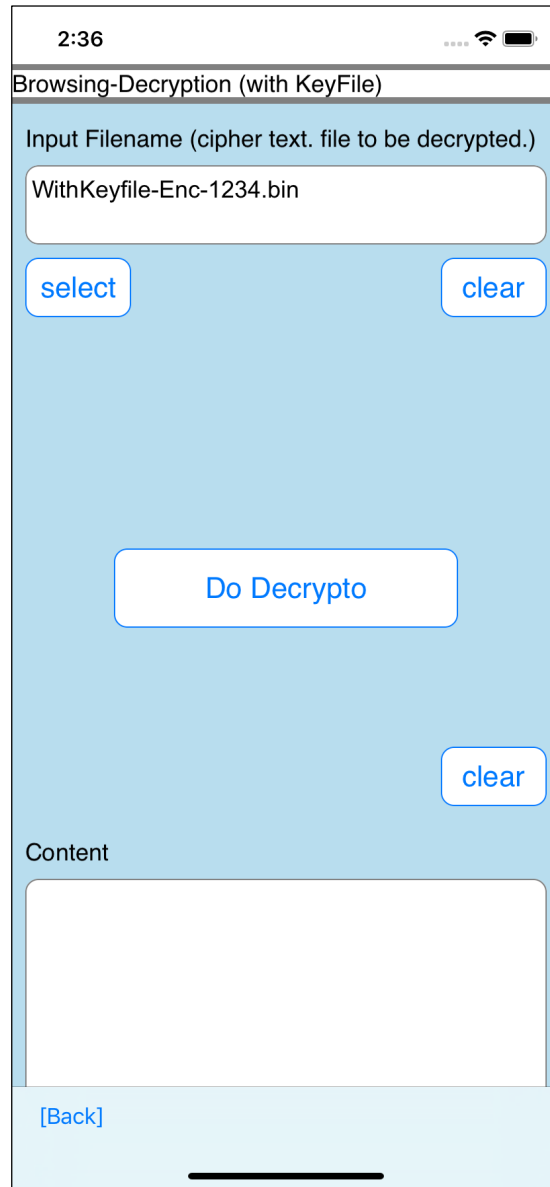

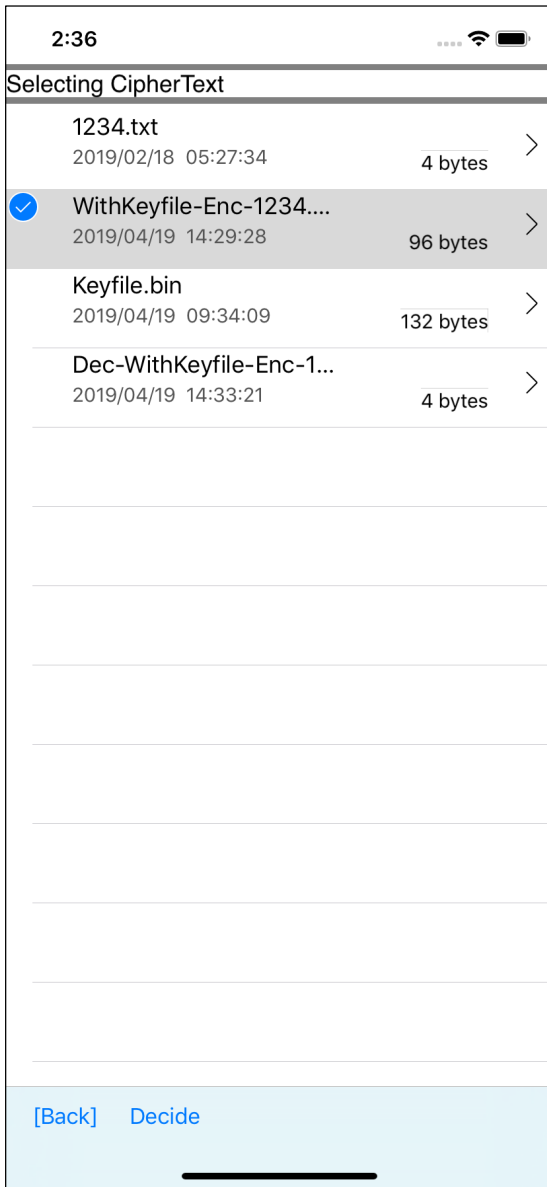

When you press the “select” button under the key file name text view, a table view like the one on the left will appear.

Select the key file and press the “Decide” button on the toolbar to return.

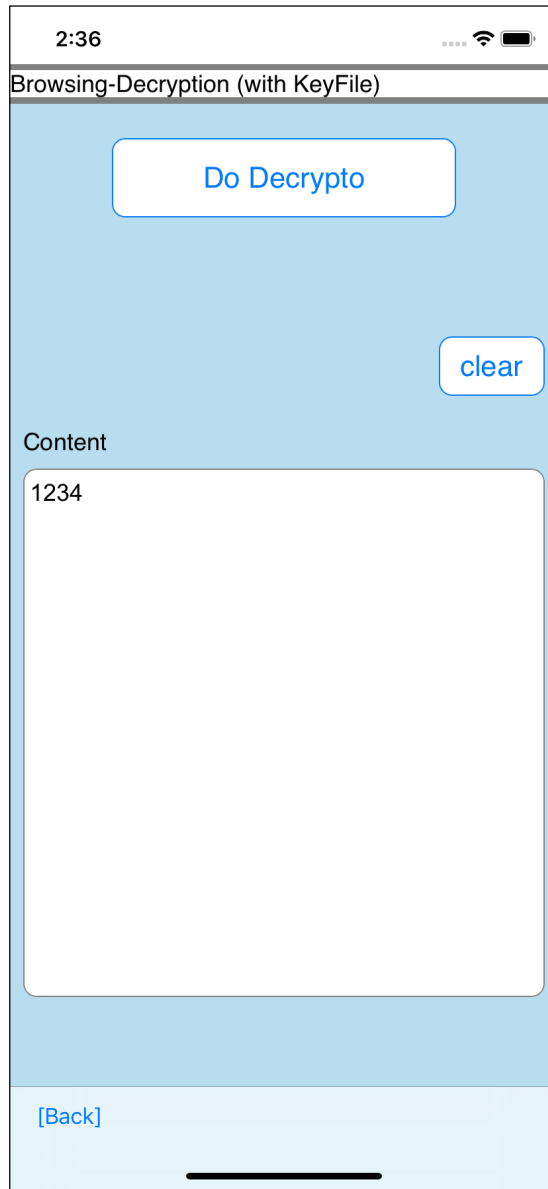

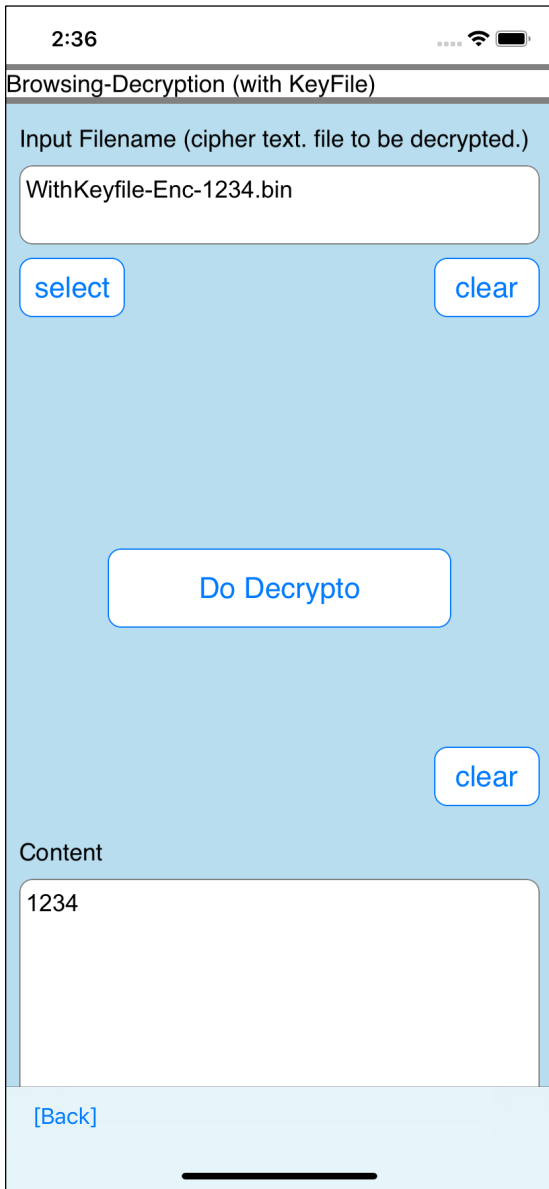

When you press the "input" button under the password text view of the key file, a view for password entry appears as shown at left.

Enter the password used to decrypt the key file and press the "Decide" button on the toolbar to return.

When you press the “select” button under the text view of the file name to be decrypted, the table view shown on the left appears.

Select a file and press the “Decide” button on the toolbar to return.

In this state, if you press the “Do Decrypto” button, the decryption result will be displayed in the text view.

The picture on the right is just a scroll.
