

## File import

rsac can accept any file transferred from other applications.

There is no restriction on the file type and size.

This view comes out when files are transferred from other applications.

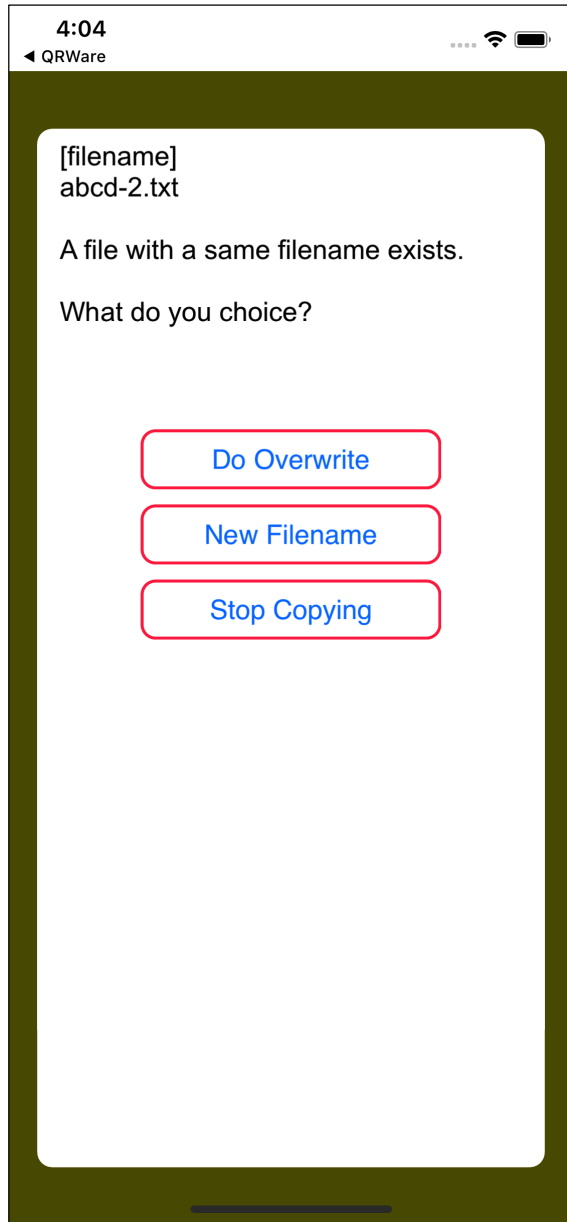

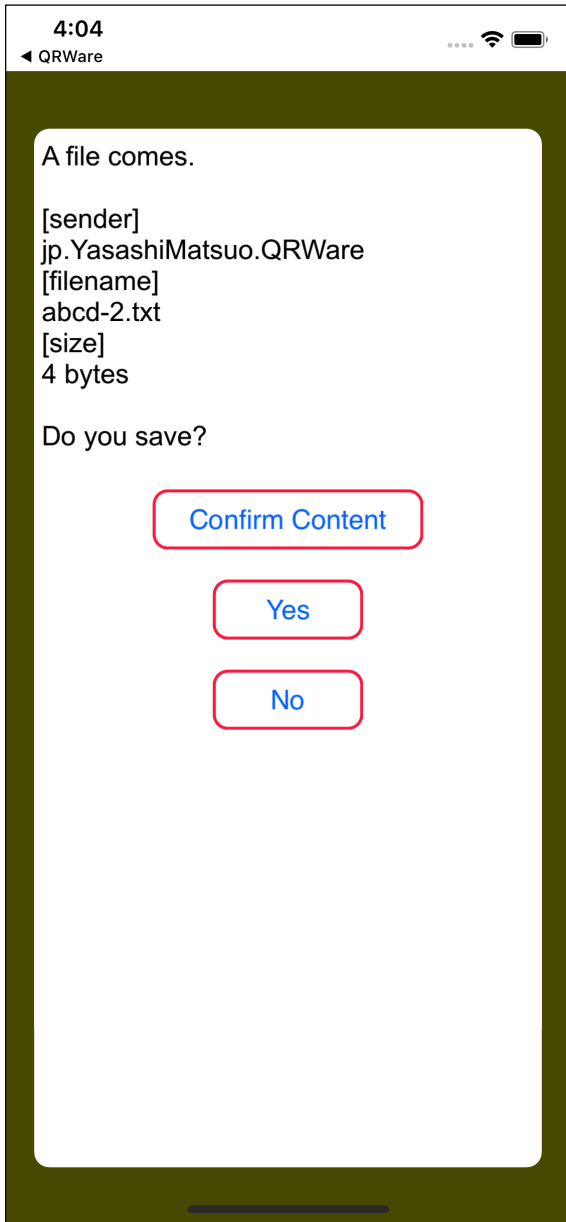

At the top, pressing the "Confirm Content" button will display the contents of the transferred file like this.

In this command, except for text files, they are displayed as Ascii Hex.

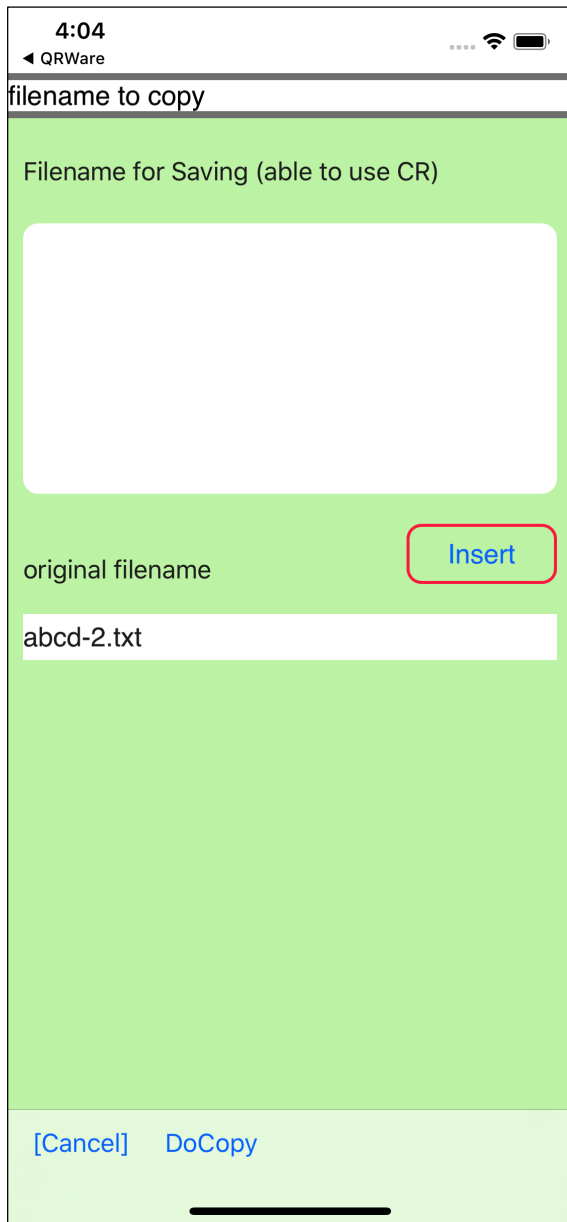

If a file with the same name does not exist, press the “Yes” button to save it with the displayed file name.

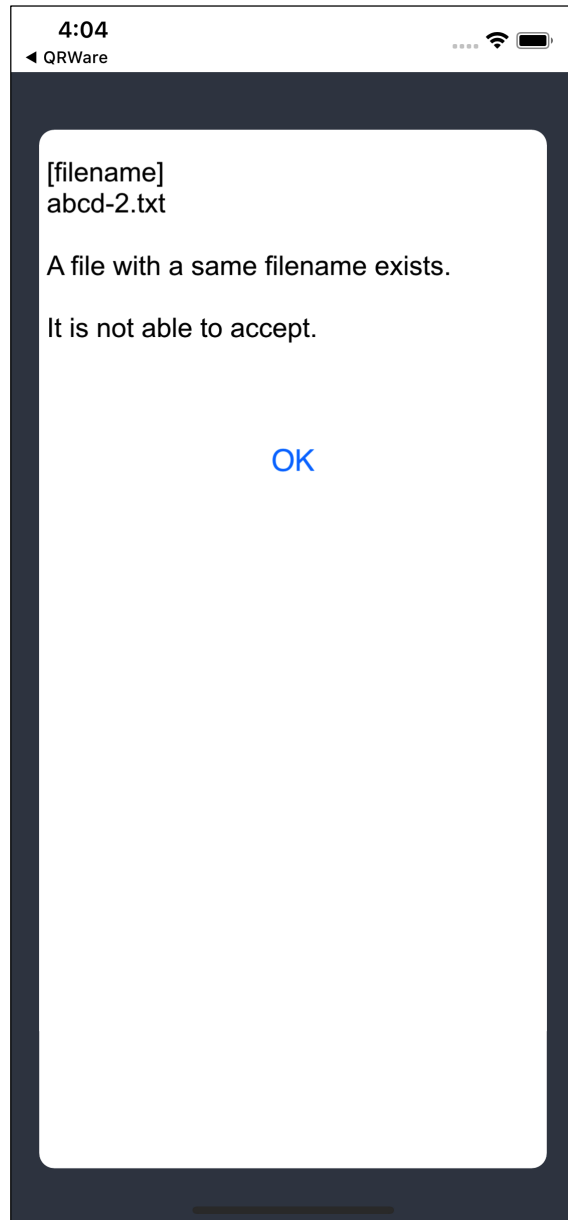

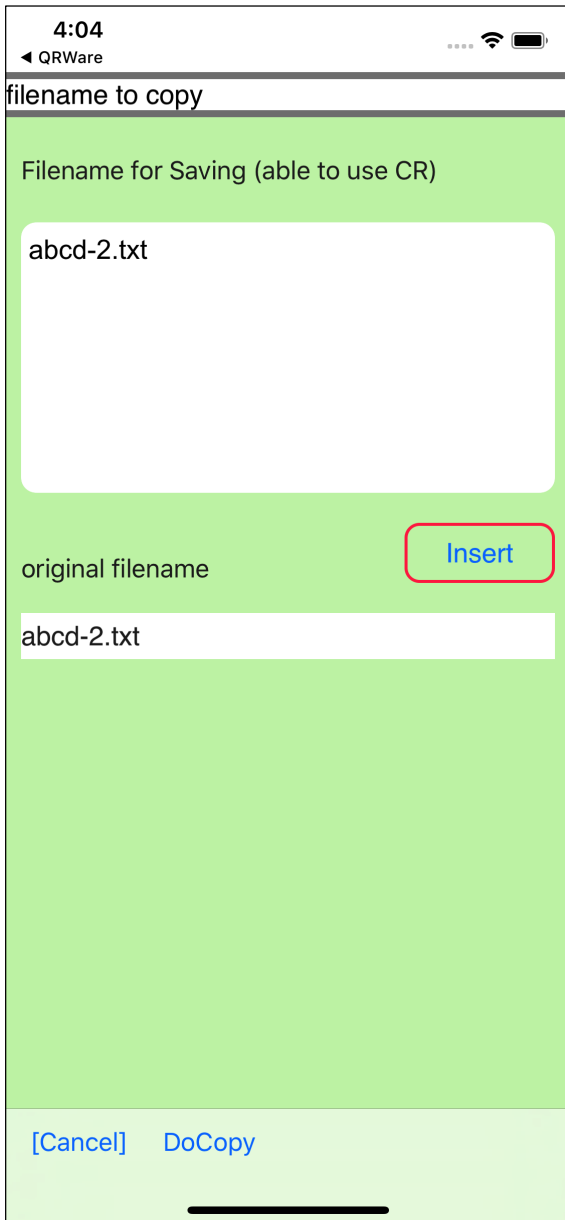

If there is a file with the same name, you will see a view to see how to process the file with the same name.

Press the top “Do Overwrite” button to overwrite immediately.

When you press the second "New Filename" button, a file name input view like this appears.

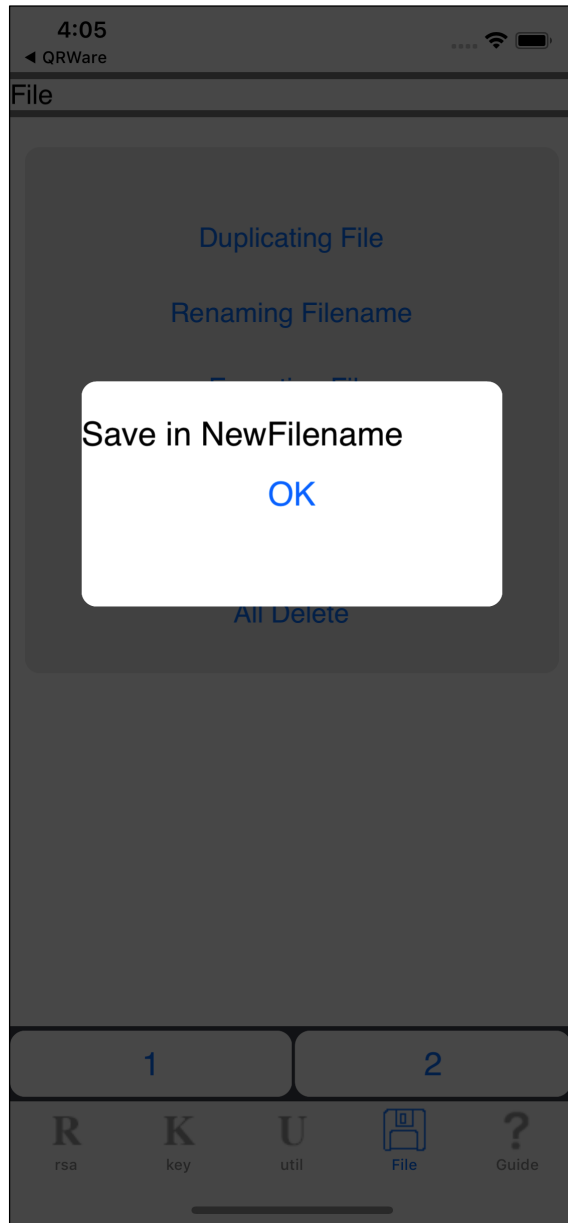

When the “Insert” button is pressed, the file name described in “original filename” is transferred to the text view as the file name.

In this state, even if you press the "Do Copy" button on the toolbar, a message will appear stating that the same file name as shown on the right can not be accepted.

Here, it is assumed that a new file name (another file name) has been selected, not an overwrite.

Therefore, the same file name is not accepted here.

Thus, if the file name is "abcd-3.txt", it can be accepted as a new file name (another file name).
