

All Delete

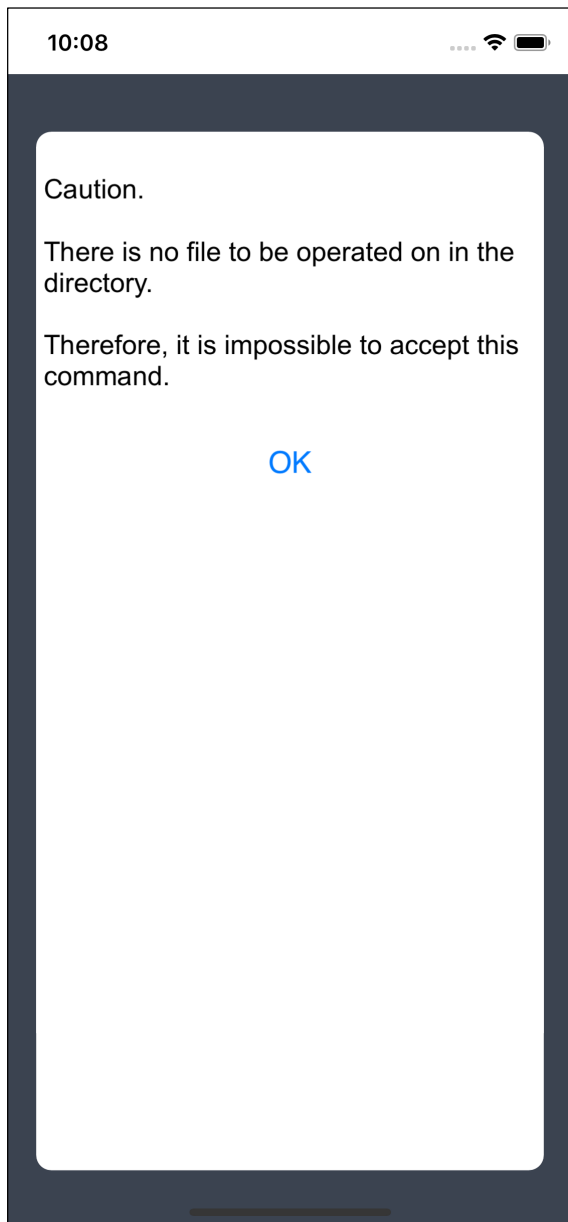

This command deletes all files.

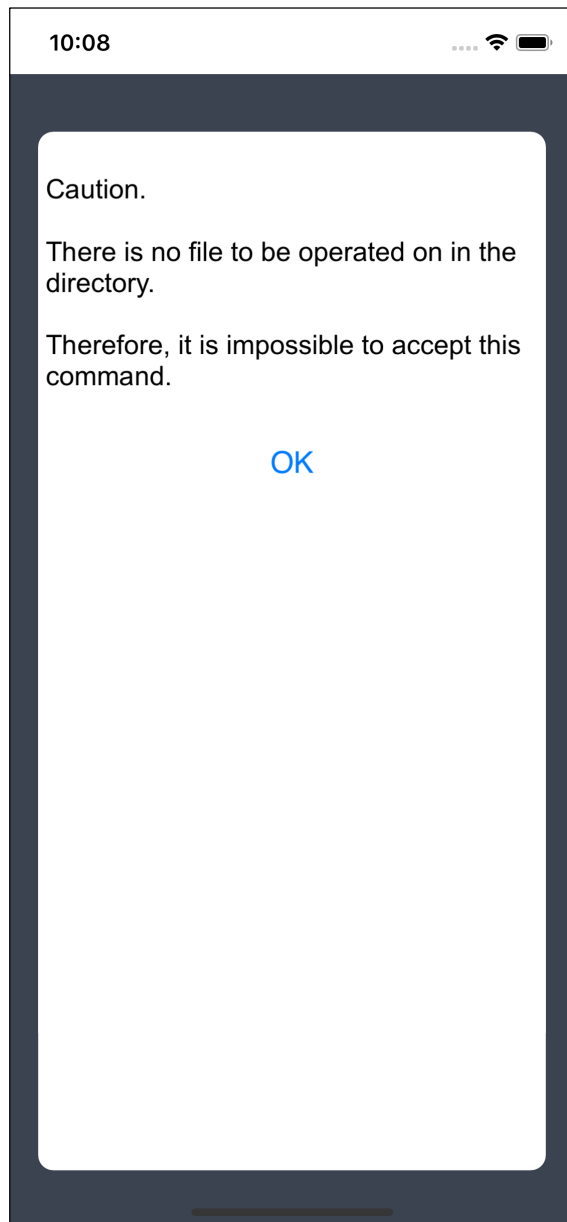

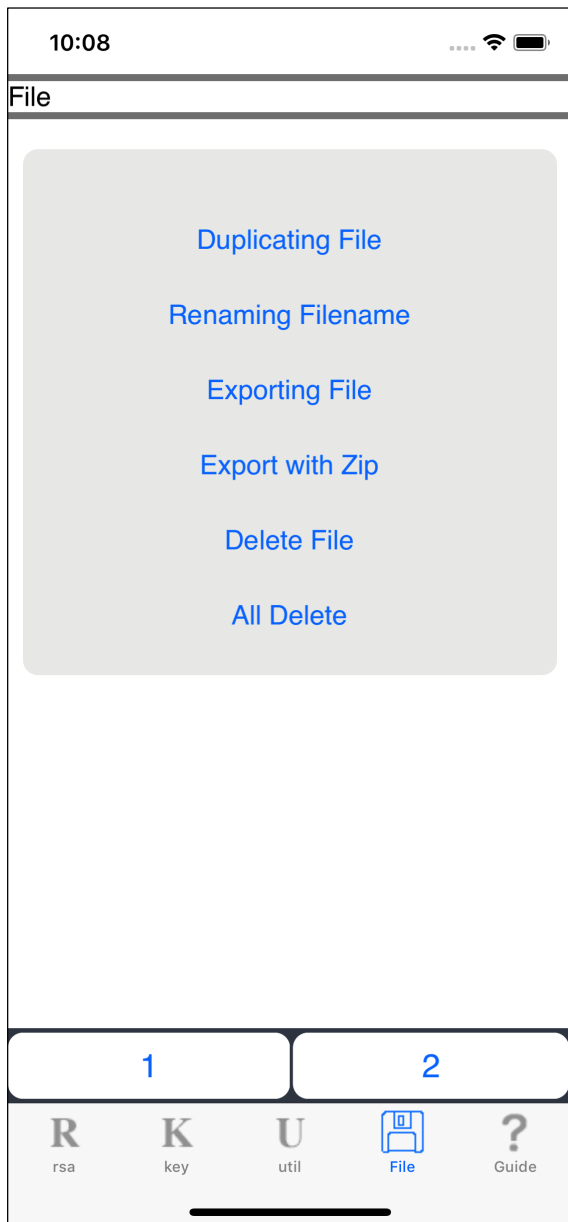

Press the main "All Delete" button at the bottom to bring up the right view. If you press "Yes", all files held by rsac will be deleted.

After deletion, this kind of report message comes out.

After deleting, if you issue a delete command again, you will get this message:
"No target file for the command."

Also, after the deletion command is issued, for example, even if you press the "Duplicating File" button, the message "There is no target file for the command" will also appear.

Since rsac is software for processing files, this message is issued when there is no file to be processed.

Create text file with text input command.

Read and file an image from Photos.

Transfer files from other applications to rsac.

If you do something like this and the file is in the rsac file storage location, this message will disappear and a view of each command will appear.

In the state "There is no file in the rsac file storage location", this message will continue to appear indefinitely.

If you forget this, you can only think that the software is hanging up, so be careful.
